#### Supervised Learning

There is a functional relationship

$$f^*:\mathbb{R}^d\to V$$

#### we would like to understand, or learn.

- Regression:  $V = \mathbb{R}$
- Classification:  $V = \{1, ..., k\}$
- ▶ To learn it, we are given *m* data points

$$(x_i, f^*(x_i) = y_i)_{i=1,...,m}$$

that reflect this functional relationship.

There is a functional relationship

$$f^*:\mathbb{R}^d\to V$$

we would like to understand, or learn.

• Regression: 
$$V = \mathbb{R}$$

• Classification: 
$$V = \{1, ..., k\}$$

► To learn it, we are given *m* data points

$$(x_i, f^*(x_i) = y_i)_{i=1,...,m}$$

that reflect this functional relationship.

#### EXAMPLE

#### SUPERVISED LEARNING: TRAINING

- ► The idea is to set up a *training procedure* (an algorithm) that *learns f*<sup>\*</sup> from the training data.
- Learning  $f^*$  means to *approximate* it by  $f : \mathbb{R}^d \to V$  sufficiently well, where  $f \in \mathcal{M}$  for a certain class of functions  $\mathcal{M}$ .
- In most cases, *f* ∈ *M* are parameterized by parameters w. This means that we have to pick an appropriate choice of parameters w for learning *f*\*.

- *Generalization*: Optimization procedure should address that *f* is to approximate *f*<sup>\*</sup> well on *unknown data points*.

#### LINEAR REGRESSION

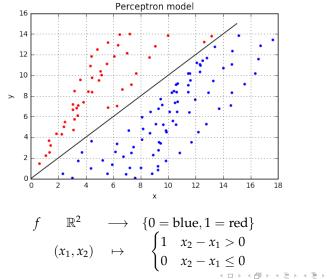

Example:  $f : \mathbb{R} \to \mathbb{R}$ 

#### PERCEPTRON

EXAMPLE:  $f : \mathbb{R}^2 \to \{0, 1\}$ 

E 590

(1)

SUMMARY

- ► How to set up the data being used for training
- ▶ A model class *M*, for example linear functions
- A cost function  $C(f, f^*)$  that evaluates the goodness of  $f \in \mathcal{M}$
- An optimization procedure that picks *f* such that *C*(*f*,*f*\*) is minimal, or very small
- Keep in mind that *f* is to perform well on previously unseen data

SUMMARY

- ► How to set up the data being used for training

#### Generalization

#### TRAINING, TEST AND VALIDATION

#### • Split $(\mathbf{X}, \mathbf{y})$ into

- training data (X<sup>(train)</sup>, y<sup>(train)</sup>)
   validation data (X<sup>(val)</sup>, y<sup>(val)</sup>)
   test data (X<sup>(test)</sup>, y<sup>(test)</sup>)

- While *training data* is to pick the optimal set of parameters
- ▶ Hyperparameters can refer to choosing subsets of *M*. For
- $\blacktriangleright$  (X<sup>(test)</sup>, v<sup>(test)</sup>) are never touched during training.
- The final goal is to minimize the cost on the test data.

TRAINING, TEST AND VALIDATION

- Split  $(\mathbf{X}, \mathbf{y})$  into
  - ▶ training data (X<sup>(train)</sup>, y<sup>(train)</sup>)
     ▶ validation data (X<sup>(val)</sup>, y<sup>(val)</sup>)
     ▶ test data (X<sup>(test)</sup>, y<sup>(test)</sup>)
- While *training data* is to pick the optimal set of parameters
- ▶ Hyperparameters can refer to choosing subsets of *M*. For
- $\blacktriangleright$  (X<sup>(test)</sup>, v<sup>(test)</sup>) are never touched during training.
- The final goal is to minimize the cost on the test data.

TRAINING, TEST AND VALIDATION

#### • Split $(\mathbf{X}, \mathbf{y})$ into

- ▶ training data (X<sup>(train)</sup>, y<sup>(train)</sup>)
   ▶ validation data (X<sup>(val)</sup>, y<sup>(val)</sup>)
   ▶ test data (X<sup>(test)</sup>, y<sup>(test)</sup>)
- While *training data* is to pick the optimal set of parameters
- ▶ Hyperparameters can refer to choosing subsets of *M*. For
- $\blacktriangleright$  (X<sup>(test)</sup>, y<sup>(test)</sup>) are never touched during training.
- The final goal is to minimize the cost on the test data.

TRAINING, TEST AND VALIDATION

- Split  $(\mathbf{X}, \mathbf{y})$  into

  - ▶ training data (X<sup>(train)</sup>, y<sup>(train)</sup>)
     ▶ validation data (X<sup>(val)</sup>, y<sup>(val)</sup>)
     ▶ test data (X<sup>(test)</sup>, y<sup>(test)</sup>)
- While training data is to pick the optimal set of parameters (which specify elements from  $\mathcal{M}$ ), using training and *validation* data in combination is for picking hyperparameters
- ▶ Hyperparameters can refer to choosing subsets of *M*. For
- $\blacktriangleright$  (X<sup>(test)</sup>, y<sup>(test)</sup>) are never touched during training.
- The final goal is to minimize the cost on the test data.

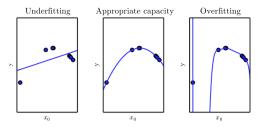

TRAINING, TEST AND VALIDATION

- Split  $(\mathbf{X}, \mathbf{y})$  into

- Choose a class of models that has the right *capacity*
- ► Capacity too large: *overfitting*
- Capacity too small: *underfitting*

# ENABLING GENERALIZATION: COST FUNCTION REGULARIZATION

Let  $C(f, f^*)$  be the cost function. Let  $\mathbf{w} = (w_1, ..., w_k)$  be the parameters specifying elements of  $f_{\mathbf{w}} \in \mathcal{M}$ .

 Usually, C refers to only known data points. That is, C evaluates as

$$C(f, f^*) = \sum_{i} C(f(x_i), y_i = f^*(x_i))$$
(2)

#### where $x_i$ runs over all training data points.

• Add a *regularization term* to cost function, and choose  $f_w$  that yields minimal

$$C(f_{\mathbf{w}}, f^*) + \lambda \Omega(\mathbf{w}) \tag{3}$$

• 
$$\lambda$$
 is a hyperparameter

# ENABLING GENERALIZATION: COST FUNCTION REGULARIZATION

Let  $C(f, f^*)$  be the cost function. Let  $\mathbf{w} = (w_1, ..., w_k)$  be the parameters specifying elements of  $f_{\mathbf{w}} \in \mathcal{M}$ .

 Usually, C refers to only known data points. That is, C evaluates as

$$C(f, f^*) = \sum_{i} C(f(x_i), y_i = f^*(x_i))$$
(2)

where  $x_i$  runs over all training data points.

$$C(f_{\mathbf{w}}, f^*) + \lambda \Omega(\mathbf{w}) \tag{3}$$

•  $\lambda$  is a hyperparameter

## ENABLING GENERALIZATION: COST FUNCTION

► Prominent examples:

- $L_1 \text{ norm: } \Omega(\mathbf{w}) := \sum_i |w_i|$
- $L_2 \text{ norm: } \Omega(\mathbf{w}) := \overline{\sum}_i w_i^2$

Rationale: Penalize too many non-zero weights

Virtually less complex model, hence virtually less capacity

Prevents overfitting, yields better generalization

# ENABLING GENERALIZATION: COST FUNCTION

► Prominent examples:

- $L_1 \text{ norm: } \Omega(\mathbf{w}) := \sum_i |w_i|$
- $L_2 \text{ norm: } \Omega(\mathbf{w}) := \sum_i w_i^2$
- Rationale: Penalize too many non-zero weights
- Virtually less complex model, hence virtually less capacity
- Prevents overfitting, yields better generalization

# ENABLING GENERALIZATION: COST FUNCTION

- ► Prominent examples:
  - $L_1 \text{ norm: } \Omega(\mathbf{w}) := \sum_i |w_i|$
  - $L_2 \text{ norm: } \Omega(\mathbf{w}) := \overline{\sum}_i w_i^2$
- ► Rationale: Penalize too many non-zero weights
- ► Virtually less complex model, hence virtually less capacity
- Prevents overfitting, yields better generalization

#### ENABLING GENERALIZATION: OPTIMIZATION Early Stopping, Dropout

Optimization can be an iterative procedure.

- ► *Early stopping*: Stop the optimization procedure before cost function reaches an optimum on the training data.
- Dropout: Randomly fix parameters to zero, and optimize remaining parameters.

#### **Prominent Supervised Learning Model Examples**

< □ > < @ > < E > < E > E のQ@

- Design matrix  $\mathbf{X} \in \mathbb{R}^{m \times d}$ , label vector  $\mathbf{y} \in \mathbb{R}^m$
- Model class: Let  $\mathbf{w} \in \mathbb{R}^d$

$$f_{\mathbf{w}} = f(\mathbf{x}; \mathbf{w}) : \quad \mathbb{R}^d \quad \longrightarrow \quad \mathbb{R} \\ \mathbf{x} \quad \mapsto \quad \mathbf{w}^T \mathbf{x}$$
(4)

- *Remark*: Note that the case w<sup>T</sup>x + b can be treated as a special case to be included in *M*, by augmenting vectors x<sub>i</sub> by an entry 1 (think about this...)
- Cost function (recall  $y_i = f^*(\mathbf{x}_i)$ )

$$C(f, f^*) := \frac{1}{m} ||(f(\mathbf{x}_1), ..., f(\mathbf{x}_m)) - \mathbf{y}||_2^2 = \frac{1}{m} \sum_{i=1}^m (f(\mathbf{x}_i) - \mathbf{y}_i)^2$$
(5)

- Design matrix  $\mathbf{X} \in \mathbb{R}^{m \times d}$ , label vector  $\mathbf{y} \in \mathbb{R}^m$
- Model class: Let  $\mathbf{w} \in \mathbb{R}^d$

$$f_{\mathbf{w}} = f(\mathbf{x}; \mathbf{w}) : \quad \mathbb{R}^d \quad \longrightarrow \quad \mathbb{R}$$
$$\mathbf{x} \quad \mapsto \quad \mathbf{w}^T \mathbf{x}$$
(4)

- ▶ *Remark*: Note that the case w<sup>T</sup>x + b can be treated as a special case to be included in *M*, by augmenting vectors x<sub>i</sub> by an entry 1 (think about this...)
- Cost function (recall  $y_i = f^*(\mathbf{x}_i)$ )

$$C(f, f^*) := \frac{1}{m} ||(f(\mathbf{x}_1), \dots, f(\mathbf{x}_m)) - \mathbf{y}||_2^2 = \frac{1}{m} \sum_{i=1}^m (f(\mathbf{x}_i) - \mathbf{y}_i)^2$$
(5)

- Cost function (recall  $y_i = f^*(\mathbf{x}_i)$ )

$$C(f, f^*) := \frac{1}{m} ||(f(\mathbf{x}_1), ..., f(\mathbf{x}_m)) - \mathbf{y}||_2^2 = \frac{1}{m} \sum_{i=1}^m (f(\mathbf{x}_i) - \mathbf{y}_i)^2$$
(5)

#### Optimization

► Solve for

$$\nabla_{\mathbf{w}} C(f_{\mathbf{w}}, f^*) = 0 \tag{6}$$

to achieve a minimum. This yields the normal equations

$$\mathbf{w} = (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{y}$$
(7)

- ► *Global optimum* if **X**<sup>T</sup>**X** is invertible
- Do this on *training data* (so X = X<sup>(train)</sup>, y = y<sup>(train)</sup>) only. Hope that cost on test data is small.

#### Optimization

► Solve for

$$\nabla_{\mathbf{w}} C(f_{\mathbf{w}}, f^*) = 0 \tag{6}$$

to achieve a minimum. This yields the normal equations

$$\mathbf{w} = (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{y}$$
(7)

# NORMAL EQUATIONS

- *Left*: Data points, and the linear function  $y = w_1 x$  that approximates them best
- *Right*: Mean squared error (MSE) depending on  $w_1$

*Remark on Perceptrons*: Optimizing is different, but also supported by a very easy optimization scheme (the *perceptron* algorithm)

# NORMAL EQUATIONS

# NEAREST NEIGHBOR CLASSIFICATION

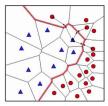

Consider appropriate distance measure

$$D: \mathbb{R}^d \times \mathbb{R}^d \longrightarrow \mathbb{R}_+ \tag{8}$$

 For unknown data point x, determine the closest given data point

$$\mathbf{x}_{i^*} := \operatorname{argmin}_i(D(\mathbf{x}, \mathbf{x}_i)) \tag{9}$$

• Predict label of **x** as  $y_{i^*}$ 

## NEAREST NEIGHBOR CLASSIFICATION

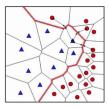

Consider appropriate distance measure

$$D: \mathbb{R}^d \times \mathbb{R}^d \longrightarrow \mathbb{R}_+ \tag{8}$$

 For unknown data point x, determine the closest given data point

$$\mathbf{x}_{i^*} := \operatorname{argmin}_i(D(\mathbf{x}, \mathbf{x}_i)) \tag{9}$$

► Predict label of **x** as *y*<sub>*i*\*</sub>

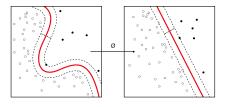

### SUPPORT VECTOR MACHINES

► *Realization*: From (7), write

$$\mathbf{w}^{T}\mathbf{x} = \sum_{i=1}^{m} \alpha_{i} \mathbf{x}^{T} \mathbf{x}_{i} = \sum_{i=1}^{m} \alpha_{i} \langle \mathbf{x}, \mathbf{x}_{i} \rangle$$
(10)

- ▶ Replace  $\langle ., . \rangle$  by different *kernel* (i.e. scalar product) k(., .), that is by computing  $\langle \phi(.), \phi(.) \rangle$  for appropriate  $\phi$
- Seek  $\alpha$ 's to maximize margin: still easy to optimize both for regression and classification!

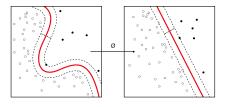

### SUPPORT VECTOR MACHINES

► *Realization*: From (7), write

$$\mathbf{w}^{T}\mathbf{x} = \sum_{i=1}^{m} \alpha_{i} \mathbf{x}^{T} \mathbf{x}_{i} = \sum_{i=1}^{m} \alpha_{i} \langle \mathbf{x}, \mathbf{x}_{i} \rangle$$
(10)

Replace (.,.) by different *kernel* (i.e. scalar product) k(.,.), that is by computing (φ(.), φ(.)) for appropriate φ

Seek  $\alpha$ 's to maximize margin: still easy to optimize both for regression and classification!

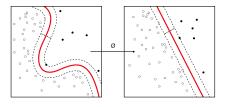

## SUPPORT VECTOR MACHINES

► *Realization*: From (7), write

$$\mathbf{w}^{T}\mathbf{x} = \sum_{i=1}^{m} \alpha_{i} \mathbf{x}^{T} \mathbf{x}_{i} = \sum_{i=1}^{m} \alpha_{i} \langle \mathbf{x}, \mathbf{x}_{i} \rangle$$
(10)

- ► Replace ⟨.,.⟩ by different *kernel* (i.e. scalar product) k(.,.), that is by computing ⟨φ(.), φ(.)⟩ for appropriate φ
- Seek  $\alpha$ 's to maximize margin: still easy to optimize both for regression and classification!
