## Programming & Python Basics

Luna Pianesi

Faculty of Technology, Bielefeld University

## Recap

1

Programming (Programming & Python Basics): Recap

## Arithmetic in Python

#### Numeric types:

- Integer: int 42
- Real valued numbers: float 42.0
- Complex numbers: complex 42+0j

#### Operators

- Addition and subtraction + -
- Multiplication and division \* / // %
- Exponentiation \*\*

## **Variables**

#### Variable assignment

- **a** = 42
- ▶ b = a 6.0

type(«name of the variable»): returns type of variable

#### Programming Basics

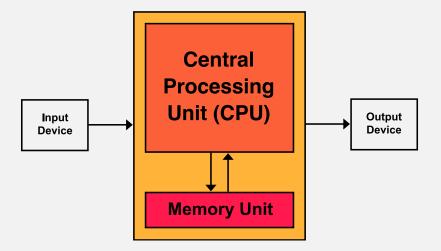

#### Data Types & Mutability

Evaluation Order Conditions & Comparisons

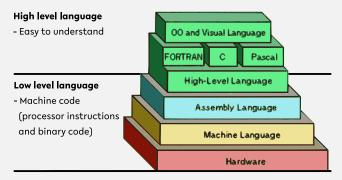

Programming (Programming & Python Basics): Programming Basics

## **Computer architecture**

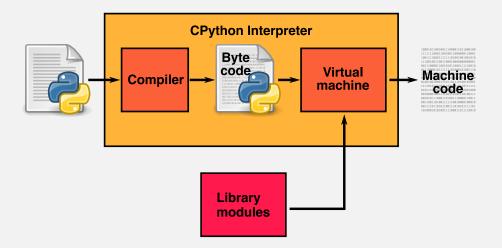

## Python compiler: reference implementation

Source: https://thebittheories.com

## Python compiler: reference implementation

## Quiz

True or false?

- "The three parts of the Von Neumann computer architecture are: Processor, RAM & Hard Disk."
- "The CPython interpreter converts Python code to the language that the computer's hardware understands."

When you try to run Python scripts, a multi-step process begins. In this process the interpreter performs three steps:

- 1. Ship off the code for execution.
- 2. Process the statements of your script in a sequential fashion.
- 3. Compile the source code to an intermediate format known as bytecode.

Identify the correct order of these steps:

 $1 \rightarrow 3 \rightarrow 2 \qquad 2 \rightarrow 3 \rightarrow 1 \qquad 1 \rightarrow 2 \rightarrow 3 \qquad 3 \rightarrow 2 \rightarrow 1$

true

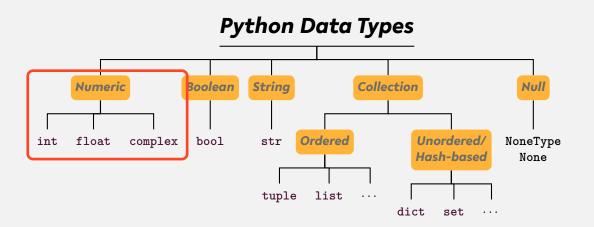

#### Programming Basics

#### Data Types & Mutability

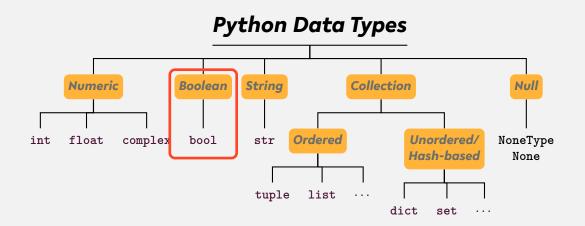

Evaluation Order Conditions & Comparisons

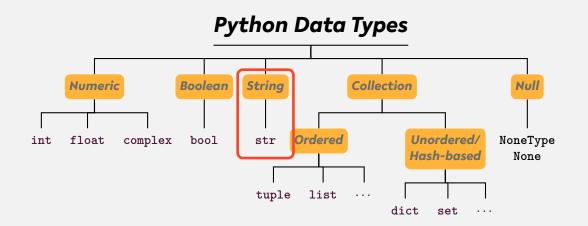

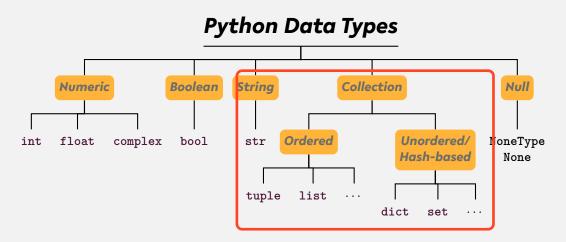

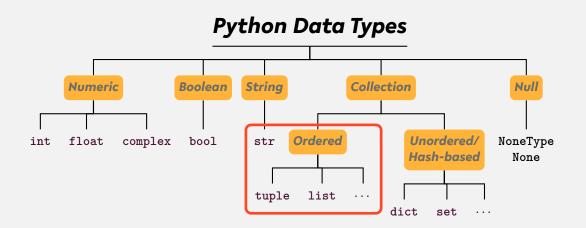

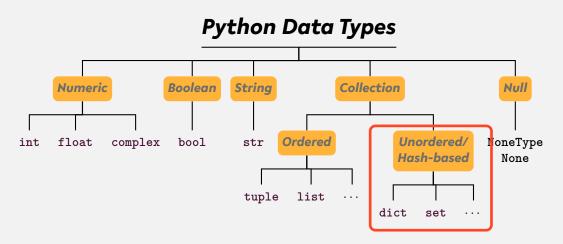

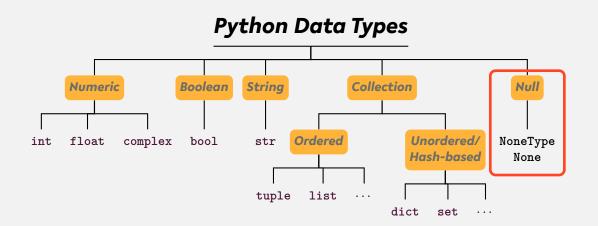

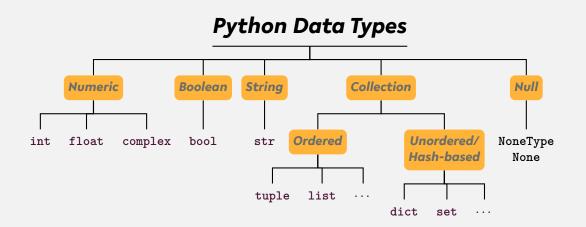

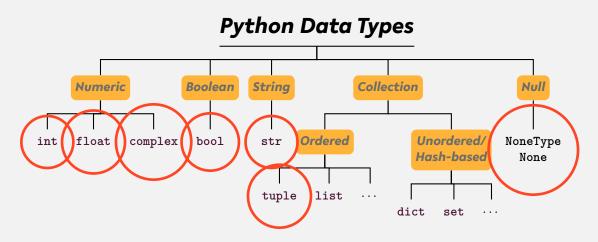

## ... and user-defined types We differentiate between **type** and **instance**!

Instances of certain types are *immutable* , i.e., *cannot be changed after creation* 

## Memory address: id

- Every instance has a unique address in memory
- id(x): memory address of instance of x
- x, y reference the same instance if and only if x is equal to y.

## Memory address: id

- Every instance has a unique address in memory
- id(x): memory address of instance of x
- **x**, y reference the same instance if and only if x is equal to y.
- Fun fact: CPython binds integers from -5 to 256 on startup.

## Types, instances, variables

We differentiate between type, instance, and variable!

```
a = list()
b = a
b.append(1)
b = 'this_is_a_string'
```

Lines 1-3: Instance of type list is assigned to variables a and b.

Line 4: Variable b refers now to a new string instance

## Type conversion

- Python is smart in converting basic data types
- int(.),float(.),tuple(.),...
- Everything evaluates to a Boolean value
  - Boolean conversion is even performed implicitly

## Quiz

#### Which of the following are valid ways to specify strings in Python:

"test" 'test" "foo'bar" 'foo'bar'

True or false?

- "In a dictionary, values are accessed by their position."
- "A variable can only reference a single instance at a time."
- "Data types are placeholders for instances."
- "Instances are placeholders for data types."
- "The expression bool('None') evaluates to False."

## Quiz

#### Which of the following are valid ways to specify strings in Python:

"test"✔ 'test" "foo'bar"✔ 'foo'bar'

True or false?

×,	"In a dictionary, values are accessed by their position."	false
2	"A variable can only reference a single instance at a time."	true
¥,	"Data types are placeholders for instances."	false
2	"Instances are placeholders for data types."	false
¥,	"The expression bool('None') evaluates to False."	false

Conditions & Comparisons

Programming (Programming & Python Basics): Evaluation Order

#### **Operator precedence**

Parentheses ( ... )

**E**xponents \*\*

Multiplication and Division \* / // %

Addition and Substraction + -

https://en.wikibooks.org/wiki/Python\_Programming/Basic\_Math

### Expression evaluation

Evaluation: operator precedence + left-to-right

(!

$$5 - 1) * ((7 + 1) / (3 - 1))$$

$$4 * ((7 + 1) / (3 - 1))$$

$$4 * ((8 ) / (3 - 1))$$

$$4 * (8 / 2)$$

$$4 * (8 / 2)$$

$$4 * 4.0$$

$$16.0$$

Automate the Boring Stuff with Python - Al Sweigart (CC-BY-NC-SA 3.0) chapter 1, figure 1-1, https://automatetheboringstuff.com/chapter1/

## **Operator Precedence**

	Operator	Description
low	=, +=, -=,  =,	Assignment expression
_	lambda	Lambda expression
	if - else	Conditional expression
	or	Boolean OR
	and	Boolean AND
	not x	Boolean NOT
	in, not in, is, is not, <, <=, >, >=, !=, ==	Comparisons, including membership tests and identity tests
	I	Bitwise OR
	^	Bitwise XOR
	&	Bitwise AND
	<<, >>	Shifts
	+, -	Addition and subtraction
	*, @, /, //, %	Multiplication, matrix multiplication, division, floor division, re- mainder 5
	+x, -x, ~x	Positive, negative, bitwise NOT
	**	Exponentiation 6
Y	await x	Await expression
high	<pre>x[index], x[index:index], x(arguments), x .attribute</pre>	Subscription, slicing, call, attribute reference
	<pre>(expressions), [expressions], key: value, expressions</pre>	Binding or parenthesized expression, list display, dictionary dis- play, set display

Programming (Programming & Python Basics): Evaluation Order

## Quiz

- What is the value of the expression 1 + 2 \*\* 3 \* 4?
- Which of the following operators has the lowest precedence?

and	+	**	%	not
-----	---	----	---	-----

- Which operation of the expression 'Tiger'[4] + 'oa'\* 4 + 'r' is executed first?
  - 'oa'\* 4 'Tiger'[4] + 'oa' 'Tiger'[4] 4 + 'r'

source (in part): https://realpython.com/quizzes

## Quiz

- What is the value of the expression 1 + 2 \*\* 3 \* 4?
- Which of the following operators has the lowest precedence?

and $\checkmark$	+	**	%	not
------------------	---	----	---	-----

- Which operation of the expression 'Tiger'[4] + 'oa'\* 4 + 'r' is executed first?
  - 'oa'\*4 'Tiger'[4] + 'oa' 'Tiger'[4] ✔ 4 + 'r'

# Conditions & Comparisons

Programming (Programming & Python Basics): Conditions & Comparisons

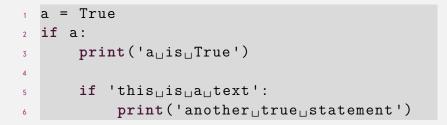

## Conditional statements: if/else clause

Programming (Programming & Python Basics): Conditions & Comparisons

#### Conditional statements: if/else

#### Conditional statements: if/else

#### Boolean operators and comparisons

#### Elementary logic: and, or, not

Variables		Boole	Boolean expression		
a	b	not a	a <b>and</b> b	a or b	
False	False	True	False	False	
False	True	True	False	True	
True	False	False	False	True	
True	True	False	True	True	

#### **Comparisons: Operators**

> ==	"is e	equal	/equivo	alen	t to	)"	
		_		-			

- != "is not equal/equivalent to"
- > "is larger than"
- "is is smaller than"
- >= "is larger or equal to"
- <= "is smaller or equal to"</p>
- is "is identical instance of"
- is not "is not identical instance of"
- in "is contained in collection"
- not in "is not contained in collection"

Programming (Programming & Python Basics): Conditions & Comparisons

# Recap

Programming (Programming & Python Basics): Recap

### Summary

- Computer architecture and Python compiler
- Python data types: int, float, str, tuple, list, dict, ...
- Operator precedence
- if/else clause
- Comparators: ==, !=, >, <, is, in, ...</pre>

#### What comes next?

- Familiarize yourself with Spyder
- Write your first program!
- Due date for this week's exercises is Wednesday, November 1, 2pm, 2023.

Next lecture: Programming & Python basics continued ...
