

Programming

Object-oriented programming

Luna Pianesi

Faculty of Technology, Bielefeld University

```
332
333
334     if extrapolate is None:
335         extrapolate = self.extrapolate
336     x = np.asarray(x)
337     x_shape, x_ndim = x.shape, x.ndim
338     x = np.ascontiguousarray(x.ravel(), dtype=np
339
340     # With periodic extrapolation we map x to the
341     # [self.t[k], self.t[n]].
342     if extrapolate == 'periodic':
343         n = self.t.size - self.k - 1
344         x = self.t[self.k] + (x - self.t[self.k]) *
345         extrapolate = False
346
347     out = np.empty((len(x), prod(self.c.shape[1:])),
348                   dtype=self._evaluate(x, nu, extrapolate, out))
349     self._evaluate(x, nu, extrapolate, out)
350     out = out.reshape(x_shape + self.c.shape[1:])
351     if self.axis != 0:
352         # transpose to move the calculated values to t
353         l = list(range(out.ndim))
354         l = l[x_ndim:x_ndim+self.axis] + l[:x_ndim] +
355         out = out.transpose(l)
356     return out
357
358 def _evaluate(self, xp, nu, extrapolate, out):
359     _bspl.evaluate_spline(self.t, self.c.reshape(self.c
360     self.k, xp, nu, extrapolate, out)
361
362 def _ensure_c_contiguous(self):
363     """
364     c and t may be modified by the user. The Cython code
365     ensures that they are C contiguous.
366     """
367     self.c = np.ascontiguousarray(self.c)
368     self.t = np.ascontiguousarray(self.t)
```

Recap

- ❖ Functions: reusable blocks of code with defined syntax
- ❖ Variable scope: local vs global
- ❖ Debugging with `try/except` statements
- ❖ Functional programming: treating functions as objects
 - ❖ First-class functions
 - ❖ Recursions
 - ❖ Lambda functions
 - ❖ `map`, `reduce` and `filter`
 - ❖ List comprehensions, generator expressions
- ❖ Lazy evaluation

Errors &
Debugging***

Classes

Modules

Packages

Programming errors

Recognizing different types of errors:

- ❖ **Syntactic:** spelling & grammar mistakes
 - ❖ e.g. $avg = (x\ y)/2$
- ❖ **Semantic:** mistakes in meaning, context, or program flow
 - ❖ e.g. $avg = x + y/2$ or $avg = (x + z)/0$

Distinction between

- ❖ Compile-time errors (syntactic, semantic)
- ❖ Runtime errors (semantic)

RuntimeError

Changing the size of my_dict in loop

```
1 # dictionary filled with arbitrary elements
2 my_dict = {'key': 'value', 1: 'text', (1, 2)
3           : 'text'}
4
5 # for-loop over keys of my_dict with control
6   variable 'key'
7
8 for key in my_dict:
9     my_dict[(key, 1, 2, 3)] = 'new_element'
```

Catching exceptions

Controlled treatment of anticipated exceptions:

```
1 while True:
2     try:
3         x = int(input("Please enter a number: "))
4         break
5     except ValueError:
6         print("Oops! That was no valid number. Try again...")
```

Raising exceptions

Use **raise** keyword to throw exceptions:

```
1 def myFunction(collection):  
2  
3     if len(collection) == 0:  
4         raise RuntimeError("Invalid input: empty collection")  
5         # do something ..  
6         return  
7  
8 myFunction(list())
```

Raising exceptions

Check properties of input parameters using the assert statement:

```
1 def myFunction(collection):  
2  
3     assert len(collection) > 0, "Invalid input: empty collection"  
4  
5     # do something ..  
6     return  
7  
8 myFunction(list())
```

Failed assertions result in an AssertionError

Debugging

PDB—the Python debugger

- ❖ Enables step-by-step proceeding of statements in Python programs
- ❖ Interaction with Python program at runtime
- ❖ Debugger is invoked by *breakpoints*
- ❖ Set breakpoint in arbitrary location of your code by
 - ❖ calling builtin “`breakpoint()`” function (Python version ≥ 3.7)
 - ❖ statement “`import pdb; pdb.set_trace()`”

Python debugger—example

```
1 # dictionary filled with arbitrary elements
2 my_dict = {'key': 'value', 1: 'text', (1, 2)
3           : 'text'}
4
5 # invoke Python debugger
6 breakpoint()
7
8 # for-loop over keys of my_dict with control
9 variable 'key'
10 for key in my_dict:
11     my_dict[(key, 1, 2, 3)] = 'new_element'
```

Classes

Modules

Packages

Python Data Types

... and user-defined types!

Creating new types

- ❖ A `class` defines a new type
- ❖ It can provide
 - ❖ class variables & functions
 - ❖ instance variables & functions

Classes—example of code reuse

```
1 class Library:
2     description = 'This is a Library'
3
4     def __init__(self, name):
5         # name the library
6         self.name = name
7         # create empty book storage on initialization
8         self.storage = list()
9
10    def addBook(self, book):
11        self.storage.append(book)
12
13    def getAllBooks(self):
14        return tuple(self.storage)
15
16 myLib = Library('Bodleian Library')
17 myLib.addBook('The Art of Computer Programming (D. Knuth)')
```

***Programming
Errors &
Debugging***

Classes

Modules

Packages

Modules

- ❖ Every `.py` file is a module
- ❖ Modules can host functions, variables, and classes
- ❖ Imported modules with `import` statement
- ❖ Should not have blocks of code that are immediately executed
- ❖ Explicit reference to module scope: `global`
- ❖ Name of module available as global variable `__name__`

Modules—example of code reuse

mystringutils.py

```
1 #
2 # A module for all kinds of string utils
3 #
4
5 def findSubstringInStrings(stringCollection,
6                             pattern):
7     occ = list()
8     for i, s in enumerate(stringCollection):
9         j = s.find(pattern)
10        while j != -1:
11            occ.append((i, j))
12            j = s.find(pattern, j+1)
13    return occ
```

myscript.py

```
1 #!/usr/bin/env python3
2
3 import mystringutils
4
5 if __name__ == '__main__':
6     myStringList = ['the_rain_in_spain',
7                    'ain\'t_no_sunshine',
8                    'she_was_greeted_with_disdain']
9
10    occOfAin = mystringutils.
11                findSubstringInStrings(myStringList,
12                                        'ain')
13    print(occOfAin)
```

***Programming
Errors &
Debugging***

Classes

Modules

Packages

Packages

- ❖ Way of structuring multiple modules into a directory hierarchy
- ❖ Package directories must contain a `__init__.py` file
- ❖ Can be imported the same way as modules
- ❖ Python itself offers many packages, and even more third-party packages are available through *package managers* such as `conda`

Quiz

- ❖ In Python, a class is _____ for an object.
- a nuisance an instance a blueprint a distraction

- ❖ Consider the following class:

```
1 class Dog:
2     def __init__(self, name, age):
3         self.name = name
4         self.age = age
```

What is the correct statement to instantiate a Dog object?

- ❖ Dog('Rufus', 3)
- ❖ Dog(self, 'Rufus', 3)
- ❖ Dog.__init__('Rufus', 3)

Quiz

- ❖ In Python, a class is _____ for an object.
- a nuisance an instance a blueprint ✓ a distraction

- ❖ Consider the following class:

```
1 class Dog:
2     def __init__(self, name, age):
3         self.name = name
4         self.age = age
```

What is the correct statement to instantiate a Dog object?

- ❖ Dog('Rufus', 3) ✓
- ❖ Dog(self, 'Rufus', 3)
- ❖ Dog.__init__('Rufus', 3)

Recap

Summary

- ❖ Compile-time and runtime errors
- ❖ Python debugger, a tool for hunting runtime errors (bugs)
- ❖ Code reuse through
 - ❖ Functions
 - ❖ Classes
 - ❖ Modules & Packages

What comes next?

- ❖ Write your first class, module, and Python script
- ❖ Due date for this week's exercises is **Wednesday, November 27, 2pm, 2024.**

Next lecture: Data management & analysis, Jupyter Notebook, text mining ...
